Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

BACKGROUND OF THE INVENTION

[0001] The present invention relates to a cleaning apparatus and a cleaning method, by which objects to be processed, such as semiconductor wafers and glass substrates for a LCD (liquid crystal display) unit etc., are immersed and cleaned in chemical and subsequently dried.

[0002] For example, in a cleaning treatment of a manufacturing process for a semiconductor device, such as LSI etc., various cleaning apparatuses are employed for removing contaminants on the surfaces of the semiconductor wafers, such as particles, organic contaminants, metallic impurities and so on, and for etching the surface of the wafer. Note, in this specification, the semiconductor wafer(s) will be called the wafer(s) for short, hereinafter. Above all, a cleaning apparatus of "wet" type comes into wide use on the grounds that the above contaminants can be removed effectively, the etching can be done and a batch processing can be accomplished to enhance the throughput in the cleaning process.

[0003] In such a wet type of cleaning apparatus, the wafers to be cleaned are subjected to a chemical cleaning process (e.g. ammonia treatment, hydrogen fluoride treatment, sulfuric acid treatment etc.), a washing cleaning process using pure water etc., and a drying process using isopropyl alcohol $[(CH_3)_2CHOH]$ or the like. Note, the isopropyl alcohol will be referred the IPA, hereinafter. Further, the cleaning apparatus is so constructed to supply the chemicals, the pure water and the IPA to processing baths in processing order and a drying room, respectively. Thus, with the above arrangement, a batch processing method where the wafer in blocks of e.g. 50 sheets are successively immersed in the processing baths and dried in the drying room, comes into wide use.

[0004] However, the provision of the processing baths and the drying room for each process causes the apparatus to be large-sized undesirably. In addition, because of a lot of opportunities for transporting the wafers in the apparatus, in other words, being exposed to atmosphere, there is a great possibility of the particles' sticking to the wafers.

[0005] Therefore, in e.g. Japanese Unexamined Patent Publication (kokai) No. 64-81230 and the same No. 6-326073 etc., there are proposed cleaning apparatuses in each of which the processing baths and the drying room are formed in one body, so that the above-mentioned chemical process and drying process are carried out in one chamber. Fig. 1 shows one example of the cleaning apparatuses in the publications, representatively.

[0006] The shown cleaning apparatus comprises a chamber 200 and chemical (liquid) 202 stored in a lower portion 201 of the chamber 200. In processing, a wafer W is firstly immersed in the chemical 202. Thereafter, the wafer W is pulled up from the chemical 202 and then

subjected to the drying process using the IPA etc. at an upper portion 203 of the chamber 200.

[0007] In the above-mentioned drying process while heating, however, there is a possibility that chemical atmosphere remaining in an upper area of the chamber 200 exerts a bad influence on the wafer W during the drying process. Furthermore, since there is a need to meet respective requirements of the chemical and drying processes simultaneously, the degree of freedom is restricted in design of the cleaning apparatus. Therefore, it is difficult to adopt various ideas to realize a high-speed cleaning process, a miniaturization of the chamber and so on. Meanwhile, in the drying process using the above IPA etc., it is generally executed to decompress the chamber by using a vacuum pump or the like. However, since the chamber in the cleaning apparatus constructed above, in which the chemical treatment etc. and the sequent drying process are executed together, has to have a large capacity Volume to a certain extent, there are problems to be solved that it is necessary to increase a wall thickness of the chamber in order to ensure the pressure tightness and a high power vacuum pump is also required.

[0008] JP-A0-3-070134 discloses a substrate drying apparatus comprising two interconnecting chambers which are separated from each other by means of a current of inert gas.

[0009] US-A-5,369,891 discloses a substrate drying apparatus comprising a vessel separable into upper and lower chambers by means of a door and means for moving the substrate from the lower, vapour processing chamber to the upper drying chamber.

[0010] US-A-5,368,649 discloses a washing and drying method and apparatus, the apparatus comprising a pressurized washing liquid tank wherein the inside of the washing tank is pressurized to a pressure higher than atmospheric pressure with gas such as air or nitrogen.

SUMMARY OF THE INVENTION

[0011] The present invention provides a cleaning apparatus for cleaning an object (W) to be processed, said apparatus comprising:

a processing bath for storing processing liquid in which said object (W) is to be immersed, said processing bath having an upper portion defining an upper opening;

a drying chamber enclosed with a case arranged entirely above said processing bath, said case having a lower portion defining a lower opening, said lower opening being located directly above and spaced apart from said upper opening of the processing bath so as to allow the passage of transporting means carrying objects between said drying chamber and said processing bath;

a transporting means for transporting said object (W) between said processing bath and said drying chamber through said upper opening and lower opening;

filling means for filling said drying chamber with an atmosphere of organic solvent; and

introducing means for introducing inert gas into said drying chamber in order to prevent the atmosphere in said processing bath from moving to said drying chamber.

c) transporting said object from said processing bath into said drying chamber;

d) filling said drying chamber with an atmosphere of organic solvent and drying said object; and

e) during immersing said object in said processing liquid, introducing inert gas into said drying chamber in order to prevent the atmosphere in said processing bath from moving to said drying chamber.

[0012] The present invention also provides a cleaning method of cleaning an object to be processed, using a cleaning apparatus including:

a processing bath for storing processing liquid in which said object is immersed, said processing bath having an upper portion defining an upper opening;

a drying chamber enclosed with a case arranged entirely above said processing bath,

said case having a lower portion defining a lower opening, said lower opening being located directly above and spaced apart from said upper opening so as to allow the passage of transporting means carrying objects to pass between said drying chamber and said processing bath;

a transporting means for transporting said object between said processing bath and said drying chamber through said upper opening and lower opening;

filling means for filling said drying chamber with an atmosphere of organic solvent;

introducing means for introducing inert gas into said drying chamber in order to prevent the atmosphere in said processing bath from moving to said drying chamber;

said cleaning method comprising the steps of:

a) transporting said object into the processing bath disposed below the drying chamber through the lower opening formed in said drying chamber while retaining said object by a retaining member supported from said drying chamber's side;

b) storing processing liquid in said processing bath before or after transporting said object from drying chamber into said processing bath and subsequently immersing said object in said processing liquid;

[0013] An advantage of the present invention is that the processing bath and the drying section are separated from each other thereby to prevent mist etc of treatment liquids from entering into a drying chamber thereby to accomplish a stable drying performance of the apparatus, and a cleaning method realized by using the cleaning apparatus.

[0014] According to the invention, owing to the introducing means for introducing gas into the drying chamber, it is possible to prevent chemicals from the processing bath entering the drying chamber.

[0015] Further, the forthcoming processing in the next processing bath can be prepared while the drying process is executed, and thus it is possible to improve throughput of the cleaning apparatus. Additionally, the arrangement allows the drying chamber and the processing bath to be designed under respective conditions independent of each other, thus making it possible to optimize the cleaning process and further miniaturize the cleaning apparatus because of the enhanced degree of freedom in the process design. Moreover, the above-mentioned arrangement allows the volume of the drying chamber to be reduced, thus making it possible to reduce the wall thickness of the drying chamber and the processing bath when it is required to decompress the drying chamber while filling up with the atmosphere of the organic solvent. In addition, it is possible to make the decompression with a low-powered vacuum pump.

[0016] Preferably, screening means are provided for screening the lower opening by a current layer of inert gas, making it possible to screen the processing bath from the drying chamber at the chemical processing for the object, so that the entering of chemicals from the processing bath to the drying chamber can be prevented.

[0017] In a preferred embodiment, when closing the opening by first and second doors, the clearance between the first and second doors can be screened by the flow of inert gas. Accordingly, it is possible to prevent an invasion of the chemical atmosphere from the processing bath to the drying chamber, furthermore.

[0018] Open and shut means are preferably provided for opening and shutting the opening of the drying chamber, making it possible to screen the drying chamber from the processing bath at the time of drying the object,

so that the object during the drying process is hardly subjected to bad influences derived from the chemicals in the processing bath.

[0019] By separating the drying member from the processing bath in a leak-tight manner at the time of drying the object, the object during the drying process is not subjected to the bad influences derived from the chemicals in the processing bath.

[0020] Meanwhile, if gas is introduced into a pipe through an end thereof and then ejected into the drying chamber through gas outlets provided along an axial direction of the pipe, there would be caused a tendency that the closer the gas outlet approaches the other end of the pipe, the less a volume of gas ejected from the gas outlet becomes. Further, in case of ejecting heated gas, there is a tendency that the closer the gas outlet approaches the other end of the pipe, the lower a temperature of gas ejected from the gas outlet gets. According to an embodiment of the invention, since respective gas flows ejected through a small number of gas outlets on the inside pipe are once joined in a space defined between the inside pipe and the outside pipe and then supplied into the drying chamber through the gas outlets on the outside pipe, it is possible to reduce the differences in volume and temperature of the ejected gas among the gas outlets furthermore.

[0021] In a preferred embodiment, the atmosphere of the drying chamber is replaced with predetermined inert gas prior to the loading of the object into the drying chamber, making it possible to lighten contact between oxygen and the object during its movement from the preceding process chamber up to the present cleaning apparatus and to restrict the natural growth of an oxide film. Moreover, as the replacement of inert gas to be executed again during the cleaning of the object can be started from a state having a lower oxygen concentration than that of the air outside, it is possible to shorten time required for lowering the concentration of oxygen to its permissible value remarkably.

[0022] By supplying the inert gas in the drying chamber while exhausting it, it is possible to enhance an efficiency in replacing the atmosphere in the drying chamber with the inert gas.

[0023] An advantage of a preferred embodiment is that it is possible to prevent particles on the inner wall of the drying chamber from flying up by the inert gas flows introduced therein and sticking on the object after cleaning or drying.

[0024] By applying ozone cleaning for forming a thin oxide film on the object after its chemical and water cleaning, it is possible to prevent an occurrence of water marks on a surface of the object.

[0025] The above and other features and advantages of this invention will become apparent, and the invention itself will best be understood, from a study of the following description and appended claims, with reference had to the attached drawings showing a preferred embodiment of the invention.

BRIEF DESCRIPTION OF THE DRAWINGS

DESCRIPTION OF THE PREFERRED EMBODIMENT

[0027] One embodiment of the present invention will be described with reference to drawings.

[0028] First of all, we now describe a cleaning apparatus for cleaning semiconductor wafers, as an example to which the invention is applied. Note, through the description, the semiconductor wafer(s) will be also referred as "wafer(s)", hereinafter. As shown in Figs. 2 and 3, the whole cleaning apparatus 1 comprises a loading section 2 for accommodating the wafers before cleaning in blocks of carriers, a cleaning section 3 for cleaning the wafers, and an unloading section 4 for picking up the wafers after cleaning and dried in the section 3 into the carriers C every predetermined number of in blocks of cassettes. Thus, the cleaning apparatus 1 of the embodiment is constituted by three processing zones.

[0029] Arranged in the loading section 2 are a transporting stand-by part 6 which causes carriers 5 having predetermined number (e.g. twenty-five sheets) of pre-cleaning wafers accommodated therein to be transported thereinto and stand by and a loader part 7 which carries out a picking-up operation of the wafers from the carriers 5, an aligning operation of respective orientation flats of the wafers, and a counting operation for the number of wafers. Further, the loading section 2 is provided with a transfer arm 8 which transports the carriers 5, which have been loaded from the outside by a transporting robot etc., to the transporting stand-by part 6 and also between the transporting stand-by part 6 and the

loader part 7.

[0030] In the cleaning section 3, three wafer transfer units 11, 12, 13 are arranged on the front side (this side in Fig. 2) of the section 3, while a piping area 14 is defined on the back side of the section 3 through partition walls, for housing various tanks for reserving processing liquids, such as chemicals, and various pipes.

[0031] On the other hand, the unloading section 4 includes an unloader part 15 for accommodating the wafers cleaned in the cleaning section 3 in the carriers 5, a transporting stand-by part 16 for causing the carriers 5 with the wafers to stand by and be transported therefrom and a transfer arm 17 for transporting the carriers 5 between the unloader part 15 and the transporting stand-by part 16.

[0032] Note, the cleaning apparatus 1 further includes a carrier transfer section 18 which transports the carriers 5 emptied in the loading section 2. The carrier transfer section 18 is equipped with a carrier conveyer 19 arranged above the cleaning section 3, a carrier stock section 20 for receiving the emptied carriers 5 from the loader part 7 of the loading section 2 by means of the transfer arm 8 and stocking the carriers 5 with and without the wafers, and a not-shown delivering part which receives the emptied carriers 5 from the carrier conveyer 19 by means of the transfer arm 17 at the unloading section 4 and delivers the emptied carriers 5 to the unloader part 15.

[0033] The cleaning section 3 is provided with the following baths in order from the side of the loader part 7: a chuck cleaning / drying bath 22 for cleaning and drying a wafer chuck 21 of the wafer transfer unit 11; a chemical cleaning bath 23 for removing impurities, such as organic contaminants, metallic impurities particles or the like, on the surface of the wafer by using the chemicals, such as ammonium hydrogen peroxide ($\text{NH}_4 / \text{H}_2\text{O}_2 / \text{H}_2\text{O}$); a wash cleaning bath 24 for cleaning the wafers cleaned in the bath 23 by e.g. pure water; a chemical cleaning bath 25 for removing metallic contaminations on the wafers by a chemical, such as a mixture of $\text{HCl} / \text{H}_2\text{O}_2 / \text{H}_2\text{O}$; a wash cleaning bath 26 for cleaning the wafers cleaned in the bath 25 by e.g. pure water; and a cleaning unit 27 of the invention for removing an oxide on the wafers by a chemical (e.g. a mixture of $\text{HF} / \text{H}_2\text{O}$), cleaning the washed wafers by the rinse (e.g. pure water) and drying the cleaned wafers; and a chuck cleaning and drying bath 28 for cleaning and drying not-shown wafer chucks of the wafer transfer unit 13.

[0034] Note, partition plates 29, 30, 31, 32 are interposed between the loader part 7 and the chuck cleaning / drying bath 22, between the wash cleaning bath 24 and the chemical cleaning bath 25, between the wash cleaning bath 26 and the cleaning unit 27, and between the chuck cleaning and drying bath 28 and the unloader part 15, respectively. These partition plates 29, 30, 31, 32 are adapted so as to open upward and shut downward in receiving and delivering the wafers by driving mechanisms which are not shown in the figures. Owing to the

provision of the partition plates 29, 30, 31, 32, it is possible to prevent atmosphere of the chemicals from diffusing into the adjoining spaces.

[0035] We now describe structure of the cleaning unit 27 with reference to Figs. 4 to 14. The cleaning unit 27 includes a cleaning bath 41 as a processing bath reserving the processing liquids of chemicals (e.g. mixture of HF/H₂O) and the rinse (e.g. pure water) and immersing the wafers to be processed in the liquids, and a cylindrical drying chamber 42 arranged above the cleaning bath 41 to drying the wafers W transported from the cleaning bath 41.

[0036] The cleaning bath 41 accommodates a wafer guide 43 and e.g. fifty sheets of wafers W carried by the wafer guide 43. Further, the cleaning bath 41 is provided, on both sides of a bottom thereof, with nozzles 44, 45 for ejecting the processing liquid for the wafers W accommodated therein. The nozzles 44, 45 may be constituted by pipes each of which has respective injection orifices formed at each interval equal to a distance between the adjoining wafers W along the direction of the wafers' arrangement. Into the nozzles 44, 45, any one of rinsing liquids, such as chemical (e.g. mixture of HF/H₂O), ozone water, pure water (DIW: deionized water) etc., is supplied from the piping area 14 shown in Figs. 2 and 3 by switching operations of switching valves 46a, 46b. The switching operations of the switching valves 46a, 46b are controlled by a not-shown controller at predetermined timing. Note, in order to prevent the oxidation of the wafers W, it is preferable to use the deaerated DIW as the rinsing liquid.

[0037] Additionally, in the circumference of the cleaning bath 41, a collect bath 47 is provided for collecting the processing liquid overflowing the cleaning bath 41. The processing liquid collected by the collect bath 47 is adapted so as to circulate in the nozzles 44, 45 through a switching valve 48, a pump 49, a filter 50 and a switching valve 51. In the switching valve 48, it is changed whether to circulate the processing liquid collected by the collect bath 47 in the above-mentioned manner or to discharge the liquid. In the switching valve 51, it is changed whether to circulate the processing liquid collected by the collect bath 47 or to supply the DIW to the nozzles 44, 45, which has been cooled to the 0 - a normal temperature (°C) degree range, more preferably 5 °C, by a cooler. Note, a damper 52 is disposed between the pump 49 and the filter 50. At the lowermost of the cleaning bath 41, an exhaust port 53 is arranged to drain the processing liquid. In the switching valve 54, it is changed whether to drain the processing liquid through the exhaust port 53 or not.

[0038] While, the drying chamber 42 is provided, on upper and lower parts thereof, with rectangular upper and lower openings 61, 62 for receiving and delivering the wafers W, respectively. A closed lid 63 is laid on the upper opening 61, while a nitrogen-gas curtain screening arrangement 60 and a slide door arrangement 64 are provided at the lower opening 62.

[0039] The lid 63 is made of resin, such as PVC (polyvinyl chloride) and PP (polypropylene) etc., and shaped like a semi-cylinder at both of the interior and exterior, as shown in Fig. 6. Thus, such a formation of the lid 63 allows the interior of the drying chamber 42 closed by the lid 63 to be formed cylindrically, while preventing a stream of nitrogen gas etc. blown against the wafers W from being turbulent. Consequently, the nitrogen gas or the like can be blown against the respective wafers W uniformly. Additionally, as shown in Fig. 7, an O-ring 65 is arranged around the periphery of the upper opening 61 and furthermore, a pair of lid fixing mechanisms 59 are disposed on both sides of the upper opening 61, for depressing the lid 63 closing the upper opening 61 securely. With such an arrangement, it is possible to enhance the sealing capability of the chamber 41 under condition that the upper opening 61 is closed by the lid 63. Provided at two positions of each rotatable rod 56 of the fixing mechanism 59 are junction plates 57 which are engageable with the lid 63 closing the upper opening 61. In operation, when respective rotary driving units 58 operate to rotate the rods 56 respectively, the junction plates 57 are brought into contact with the lid 63, so that it is urged against the periphery of the opening 61 firmly.

[0040] Arranged in the vicinity of the drying chamber 42 is a lid actuator 66 which drives to open and shut the lid 63. As shown in Fig. 8, the lid actuator 66 includes a cylinder 68 for rotating a pivot arm 67 having an end fixed to the lid 63; and another cylinder 69 for moving the lid 63 and these rotating arrangement (the cylinder 68, the arm 67) upward and downward. In operation for opening the lid 63, the lid actuator 66 firstly moves the lid 63 closing the upper opening 61 upward (see ① of Fig. 8). Subsequently, the lid actuator 66 further rotates the lid 63 to a position apart from the upper opening 61 (see ② of Fig. 8) and moves the lid 63 downward (see ③ of Fig. 8). In this way, the upper opening 51 is opened. On the contrary, when it is required to close the upper opening 61 by the lid 63, the above-mentioned operations will be executed in reverse order (i.e. ③ → ② → ① of Fig. 8).

[0041] As shown in Fig. 9, the nitrogen-gas curtain screening arrangement 60 comprises a nitrogen-gas exhaust part 59a and a nitrogen-gas intake part 59b which are opposed to each other on both left and right ends of the opening 62 of the drying chamber 42. Thus, owing to the provision of the parts 59a, 59b, the arrangement 60 is adapted so as to form a current layer 59c of nitrogen gas in order to screen the opening 62. Note, in the specification, the current layer 59c will be also referred as "nitrogen-gas curtain 59c", hereinafter.

[0042] As shown in Fig. 10, the slide door arrangement 64 comprises a rectangular flange 70 disposed between the cleaning bath 41 and the drying chamber 42, a slide door 72 inserted into an opening 71 formed in the flange 70 to open and close an interior of the flange 70, and a cylinder 73 for driving the slide door 72. Similar

to the lid 63, the slide door 72 is made of resin, such as PVC (polyvinyl chloride) and PP (polypropylene) etc., and rectangular-shaped similarly to the lower opening 62. Further, as shown in Fig. 11, respective air grip seals 72a, 72b are arranged along outer peripheries on both sides of the slide door 72, while an O-ring 72c is arranged on a bottom face of the drying chamber 42 so as to extend along an inner side of the air grip seal 72a. In the modification, the O-ring 72c may be arranged along an outside of the air grip seal 72a. In operation, under condition that the slide door 72 is accommodated in the flange 70, both air grip seals 72a, 72b are inflated so as to come into tight contact with the bottom face of the drying chamber 42 and a bottom face of the flange 70, respectively. Subsequently, the O-ring 72c is brought into contact with the surface of the slide door 72 tightly. In this way, the lower opening 62 is closed tightly.

[0043] As shown in Fig. 12, the wafer guide 43 is provided, at an lower end of the carrying member 74 thereof, with a wafer support 75 for supporting a plurality of wafers W (e.g. 50 sheets). The wafer support 75 consists of an intermediate supporting rod 76 and two lateral supporting rods 77, 78 arranged in parallel with each other on both sides of the rod 76. Respective ends of the rods 76, 77, 78 are fixed with a lower end of the carrying member 74, while the other ends of the rods 76, 77, 78 are secured to a fixing member 79. Each of the rods 76, 77, 78 has a plurality of retaining grooves 80, 80, ..., 80 (e.g. fifty grooves) formed at predetermined intervals in the longitudinal direction. The wafer guide 43 is made of materials exhibiting superior characteristics in corrosion resistance, heat resistance and durability, for example, PEEK (polyether ether ketone), Qz (quartz) and so on.

[0044] A guide elevating rod 81 is fixed to an upper end of the wafer guide 43. As shown in Figs. 5 to 7, the guide elevating rod 81 is adapted so as to move upward and downward, projecting to the outside through a gripping mechanism 82 arranged on the top of the drying chamber 42. The gripping mechanism 82 includes an air grip seal 82a surrounding the guide elevating rod 81. When driving the guide elevating rod 81 up and down, air is released from the air grip seal 82a. On the contrary, when it is required to close up the drying chamber 42, the air grip seal 82a is inflated.

[0045] The upper end of the guide elevating rod 81 is connected with a wafer-guide Z-axis mechanism 83 arranged behind the drying chamber 42. Since the wafer-guide Z-axis mechanism 83 operates to move the guide elevating rod 81 up and down, the wafers W carried by the wafer guide 43 are transported between the cleaning bath 41 and the drying chamber 42 through the lower opening 62. Further, as shown in Fig. 5, the wafer transfer unit 13 (see Fig. 3) is arranged in front of the cleaning unit 27. In operation, a wafer chuck 84 provided on the wafer transfer unit 13 receives, for example, fifty sheets of wafers W from the neighboring wash cleaning bath

26 and delivers them to the wafer guide 43 in the drying chamber 42. Furthermore, the wafer chuck 84 receives, for example, fifty sheets of wafers W from the wafer guide 43 in the drying chamber 42 and delivers them to the unloader part 15 of the unloading section 4.

[0046] As shown in Figs. 4 and 13, on both sides of the upper part of the drying chamber 42, two nozzles 85, 86 are arranged so as to blow the nitrogen gas and a mixed gas of nitrogen and the IPA over the wafers W carried by the wafer guide 43 in a downward-flowing manner. Each of the nozzles 85, 86 is constituted by an inside pipe 88a and an outside pipe 88b having the pipe 88a inserted therein. The inside pipe 88a is provided, along a direction to arrange the wafers W, with a plurality of gas outlets 87a at intervals of a predetermined length. On the other hand, the outside pipe 88b is provided, along the arrangement direction of the wafers W, with a plurality of gas outlets 87b at intervals of a constant distance which is smaller than the predetermined length between the adjoining gas outlets 87a and which may be a pitch of the wafers W adjoining, for example. That is, the nozzles 85, 86 are constructed in a manner that gas, which has been ejected from a small number of gas outlets 87a in the inside pipe 88a, passes through a space between the circumferential face of the inside pipe 88a and that of the outside pipe 88b and subsequently flows into the drying chamber 42 through a large number of gas outlets 87b in the outside pipe 88b. With the above-mentioned arrangement, it is possible to reduce fluctuations in volume (flow rate) and temperature of the gas ejected from the gas outlets 87b of the nozzles 85, 86, which fluctuations would be caused in case of supplying gas from one end of the inside pipe 88a.

[0047] Into the nozzles 85, 86, a mixed gas composed of the IPA and heated nitrogen gas is supplied from an IPA evaporator 89 through a control valve 90 and a filter 91. Into the IPA evaporator 89, the heated nitrogen gas is supplied from a nitrogen heater 92 through a control valve 93, while the IPA is also supplied from an IPA tank 94 through a control valve 95. Similarly, the nitrogen is supplied to the IPA tank 94 through a control valve 96, while the IPA is also supplied to the IPA tank 94 through a control valve 97.

[0048] On the other hand, as shown in Figs. 4 and 13, the drying chamber 42 is provided, on both sides of the lower part, with exhaust ports 98, 99 for discharging the nitrogen gas etc. blown out of the nozzles 85, 86. The exhaust ports 98, 99 are communicated with a exhaust pump 110. Also communicated with the exhaust ports 98, 99 are respective rectifying plates 101, 102 as rectifying means, which having a plurality of inlets 100, 100, ..., 100 for sucking the nitrogen gas etc., which have been blown out of the nozzles 85, 86, through respective parts at the lower part of the drying chamber 42 uniformly. With the arrangement, as shown by dotted lines of Fig. 14, the nitrogen gas etc., which have been blown out of the injection holes 87 of the nozzles 85, 86, are flowing on the surfaces of the wafers W and subse-

quently sucked from the inlets 100 of the rectifying plates 101, 102. Thus, owing to the above-mentioned flow of the nitrogen gas etc., it is possible to prevent the occurrence of turbulence in the flows of the nitrogen gas etc. Note, the drying chamber 42 is also provided, at the lower part, with a drain port (not shown) for discharging the liquids.

[0049] Again in Fig. 4, a pair of panel heaters 103, 104 are arranged on both sides of a center of the drying chamber 42. These panel heaters 103, 104 are electrically connected to a panel heater controller 105 for controlling the temperature in the chamber 42. In this way, the temperature of the chamber 42 is maintained to the extent that, for example, the IPA boils.

[0050] As shown in Fig. 4, provided between the cleaning bath 41 and the drying chamber 42, for example, on both sides of a space above the surface of the bath 41 are nozzles 106, 107 which blow the nitrogen gas against the wafers W during transporting from the bath 41 to the chamber 42. The structures of the nozzles 106, 107 are substantially similar to those of the above-mentioned nozzles 85, 86. Into the nozzles 106, 107, the cooled nitrogen gas is supplied through a cooler 108 for cooling the nitrogen gas to the 0 - a normal temperature (°C) degree range, more preferably 5 °C, and a control valve 109.

[0051] We now describe an operation of the cleaning apparatus 27 constructed above, in accordance with a flow chart of Fig. 15. Note, the following operational control is executed by a not-shown controller.

[0052] First of all, on condition of closing the lid 63 on the top of the chamber 42 and the slide door 72 (or even opening) prior to bringing the wafers W from the outside into the drying chamber 42, the atmosphere in the drying chamber 42 (or the atmosphere in the drying chamber 42 and the processing bath 41) is replaced with nitrogen gas ejected from the nozzles 85, 86, while exhausting the atmosphere in the drying chamber 42 (see step 1401 of Fig. 16). Next, the lid 63 on the top of the drying chamber 42 is opened (step 1402 of Fig. 17) and then, the wafer chuck 84 is lowered into the chamber 42 and the wafers W are delivered to the wafer guide 43 in the chamber 42 (step 1403 of Fig. 18).

[0053] At sequent step 1404 of Fig. 19, it is executed to close the lid 63 on the top of the chamber 42 and open the slide door 72 at the bottom of the chamber 42 (see Fig. 19). Then, the wafer guide 43 carrying the wafers W is lowered to transfer them into the cleaning bath 41 (step 1405 of Fig. 20) and the nitrogen-gas curtain screening arrangement 60 is activated to close the opening 62 at the bottom of the drying chamber 42 by the current layer 59c of nitrogen gas (step 1406 of Fig. 21).

[0054] Thereafter, in the cleaning bath 41, it is executed to inject the mixture of HF / H₂O through the nozzles 44, 45 and subsequently immerse the wafers W into the reserved mixture of HF / H₂O for chemical cleaning (step 1407 of Fig. 22). In this step, it is also applicable

that the mixture has been reserved in the cleaning bath 41 in advanced, before the wafers are transported into the cleaning bath 41. The mixture of HF / H₂O ejected from the nozzles 44, 45 forms a current directing the wafers W in the cleaning bath 41 thereby to promote the chemical cleaning. Next, the mixture of HF / H₂O is discharged and thereafter, the DIW is ejected from the nozzles 44, 45 to rinse the wafers W (step 1408 of Fig. 22). As well as the mixture of HF / H₂O, the DIW ejected from the nozzles 44, 45 forms a current directing the wafers W in the cleaning bath 41 thereby to promote the rinsing process. Note, in the modification, the supply of DIW may be started without discharging the mixture of HF / H₂O so that the density of the mixture becomes to be thin gradually. Subsequently, the ozone water is ejected from the nozzles 44, 45 to form thin films of pure silicon oxide on silicon surfaces of the wafers W (step 1409 of Fig. 22). If necessary, the DIW may be subsequently ejected from the nozzles 44, 45 to remove the ozone water sticking on the surfaces of the wafers W.

[0055] On the other hand, while the above cleaning process is carried out, the nitrogen gas for interchange is supplied into the drying chamber 42 through the nozzles 85, 86 (step 1412 of Fig. 22). Thereafter, the IPA or the mixture of the IPA and nitrogen is blown out from the nozzles 85, 86, so that the drying chamber 42 is filled up with the atmosphere of IPA (step 1411).

[0056] Next, it is executed to cease operating of the nitrogen-gas curtain screening arrangement 60 and open the nitrogen-gas curtain 59c (step 1412 of Fig. 23) and the wafer guide 43 carrying the wafers W is elevated to transport them into the drying chamber 42 successively (step 1413 of Fig. 24). Note, in the modification, the wafers W may be conveyed into the drying chamber 42 while closing the nitrogen-gas curtain 59c without stopping the operation of the nitrogen-gas curtain screening arrangement 60. During the transportation of the wafers W, the nitrogen gas is blown against the wafers W on transportation from the cleaning bath 41 to the drying chamber 42 by the nozzles 106, 107.

[0057] Subsequently, upon closing the slide door 72 at the bottom of the drying chamber 42 (step 1414 of Fig. 25), the IPA or the mixture of the IPA and nitrogen is blown against the wafers W in the drying chamber 42 through the nozzles 85, 86 downwardly (step 1415 of Fig. 26). After that, the drying chamber 42 is exhausted to be decompressed (step 1416 of Fig. 26). After ceasing exhausting of the drying chamber 42, the nitrogen gas is introduced into the drying chamber 42 through the nozzles 85, 86 to recover the chamber 42 of the atmospheric pressure (step 1417 of Fig. 26). Then, as shown in Fig. 30 for instance, the control valve 90 is controlled so that a blasting volume of nitrogen gas is relatively small at the beginning of the recovering and subsequently, increased gradually or in a stepped manner.

[0058] At sequent step 1418 of Fig. 27, it is executed to open the lid 63 on the top of the drying chamber 42 and thereafter, the wafer chuck 84 is lowered into the

chamber 42 to receive the wafers W from the wafer guide 43 (step 1419 of Fig. 28). Then, the wafer chuck 84 is elevated to unload the wafers W to the outside of the drying chamber 42 (step 1420 of Fig. 29).

[0059] Thus, in accordance with the cleaning apparatus 27 of the embodiment, the drying chamber 42 and the cleaning bath 41 are separated from each other up and down and the opening 62 of the drying chamber 42 is screened by the nitrogen-gas curtain 59c during the cleaning process in the cleaning bath 41, while the opening 62 of the drying chamber 42 is closed by the slide door 72 at the drying process in the drying chamber 42. Therefore, it is possible to prevent the chemical in the cleaning bath 41 from exerting bad influences on the drying process of the wafers W. In addition, since the arrangement allows the drying chamber 42 and the cleaning bath 41 to be designed under respective conditions independent of each other, it is possible to make the cleaning process more rapid and further miniaturize the cleaning apparatus 27 because of the enhanced degree of freedom in the process design. For instance, in order to finish off the drying process quickly, the drying chamber 42 may be provided with the panel heaters 103, 104 for heating the interior of the chamber 42. Or again, the atmosphere in the drying chamber 42 may be replaced with the IPA while cleaning the wafers W in the cleaning bath 41 in view of the prompt drying process.

[0060] Further, since the drying chamber 42 can be constructed to be compact in comparison with that of the conventional cleaning apparatus where the processing bath and the drying chamber have been accommodated in one chamber, it is possible to carry out the drying process more effectively. Furthermore, since it is possible to decrease the volume of the drying chamber 42 to the utmost, there is no need to form the drying chamber 42 with a great pressure tightness. Thus, it is possible to reduce the wall thickness of the drying chamber 42 and decrease the required power of the vacuum pump 110 for decompression.

[0061] In the cleaning apparatus 27 of the embodiment, it is possible to prevent the occurrence of water marks on the surfaces of the wafers W because the ozone cleaning is carried out to form the thin film of pure silicon oxide on the silicon surfaces of the wafers W after executing the chemical cleaning using the mixture of HF / H₂O and the water cleaning.

[0062] Further, since, in the respective processes of replacing the atmosphere in the drying chamber 42 with the nitrogen gas, it is blown out from the nozzles 85, 86 while exhausting the drying chamber 42, it is possible to enhance the efficiency of replacement.

[0063] Additionally, as the atmosphere of the drying chamber 42 is replaced with the nitrogen gas prior to the loading of the wafers W into the drying chamber 42, it is possible to shorten the time required for the above replacing process of the nitrogen gas to be processed during the cleaning process of the wafers W. Moreover, since the replacement of the nitrogen gas to be proc-

essed during the cleaning process of the wafers W may be started from a state having a lower oxygen concentration than that of the air outside, it is possible to shorten the time required for lowering the concentration of oxygen to its permissible value remarkably.

[0064] According to the cleaning apparatus 27 of the embodiment, when recovering the drying chamber 42 of the atmospheric pressure by introducing the nitrogen gas into the chamber 42 from its decompressed condition, the blasting volume of nitrogen gas is relatively small at the beginning of the recovering and subsequently, increased gradually or in the stepped manner. Consequently, it is possible to prevent particles on the inner wall of the drying chamber 42 from flying up by the nitrogen-gas flows introduced into the chamber 42 and sticking on the wafers W after cleaning or drying.

[0065] Now, it is noted that the present invention is not limited to the above-mentioned embodiment and various changes and modifications may be made within a scope of concept of the art.

[0066] Note, in order to prevent the chemical mists from entering from the cleaning bath 41 to the drying chamber 42, the nitrogen gas may be introduced into the drying chamber 42 through the nozzles 85, 86 thereby to bring the atmosphere in the drying chamber 42 into a high-pressure condition in comparison with that in the cleaning bath 41.

[0067] Further, as means for screening the opening 62 of the drying chamber 42 in process of cleaning the wafers W in the cleaning bath 41, as shown in Fig. 31, a combination of a rotary doors arrangement and the nitrogen-gas curtain screening arrangement is applicable to the means. The rotary doors arrangement is constituted by a pair of rotary doors 121 and a pair of driving units 122 for rotating the rotary doors 121 respectively. The respective rotary doors 121 also serve as structures of the nitrogen-gas exhaust part 59a and the nitrogen-gas intake part 59b between which the current layer (nitrogen-gas curtain) 59c is formed for screening a clearance between the respective ends of the closing rotary doors 121. Note, the respective rotary doors 121 and the nitrogen-gas curtain 59c are adapted so as to open or close simultaneously.

[0068] Again, although the nitrogen gas is used as the inert gas in the above-mentioned embodiment, other inert gases, such as argon (Ar), helium (He) etc., may be used as a substitute of the nitrogen gas. It is obvious that the heating of these inert gases in the drying step allows the drying process to be carried out more effectively. While, needless to say, they do not have to be heated.

[0069] Although the IPA is employed as a water-soluble organic solvent having an function to decrease the surface tension of pure water with respect to the object to be processed in the embodiment, the IPA may be replaced with other organic solvents, for example, single-charged alcohol (e.g. methanol), ketonic kinds (e.g. acetone), ether kinds (e.g. methyl alcohol), multicharged

alcohol (e.g. ethylene glycol) or the like.

[0070] Although the chemical treatment using the mixture of HF / H₂O and the rinsing and drying processes using the pure water are executed in the cleaning apparatus 27 in the above-mentioned embodiment, it should be understood that a cleaning apparatus for and a method of executing at least the drying process and one or more other processes will be included in the scope of the invention. For example, the chemical process using the mixture of HF / H₂O, the rinsing process using the pure water, the chemical process using the mixture of NH₄ / H₂O₂ / H₂O, and the chemical process using the mixture of HCl / H₂O₂ / H₂O etc. are applicable to the above other processes. Accordingly, of course, the cleaning apparatus of the invention may be constructed so as to carry out, for example, the chemical process using the mixture of NH₄ / H₂O₂ / H₂O, the chemical process using the mixture of HCl / H₂O₂ / H₂O, the chemical process using the mixture of HF / H₂O, the rinsing process using the pure water, and the drying process.

[0071] Although the above-mentioned embodiment is one example of the cleaning apparatus of the invention in association with a cleaning equipment having the processing baths in processing order, it is possible to use the present cleaning apparatus as a stand alone type apparatus. In this case, for example, it is also possible to construct the stand alone apparatus by connecting a transfer section having the loader part and unloader part with the present cleaning apparatus.

[0072] In addition, it will be understood that the object to be processed is not limited to the semi-conductor wafer of the embodiment, so that a LCD substrate, a glass substrate, a CD substrate, a photomask, a print substrate, a ceramic substrate or the like is applicable to the object to be processed by the present apparatus and method.

[0073] As mentioned above, according to an embodiment of the present invention, as the inert gas is introduced into the drying chamber so that the atmosphere in the drying chamber is brought to the high-pressure condition in comparison with the processing bath, it is possible to prevent the entering of chemicals from the processing bath to the drying chamber. Further, since the forthcoming process in the next processing bath can be prepared while the drying process is executed, it is possible to improve throughput of the cleaning apparatus. Additionally, since the arrangement allows the drying chamber and the processing bath to be designed under respective conditions independent of each other, it is possible to optimize the cleaning process and further miniaturize the cleaning apparatus because of the enhanced degree of freedom in the process design. Moreover, since the above-mentioned arrangement allows the volume of the drying chamber to be reduced, it is possible to reduce the wall thickness of the drying chamber and the processing bath when it is required to decompress the drying chamber while filling up with the

atmosphere of the organic solvent. In addition, it is possible to make the decompression with the low-powered vacuum pump.

[0074] Additionally, according to an embodiment, of the invention, owing to the provision of the screening means for screening the opening by the current layer of inert gas, it is possible to screen the processing bath from the drying chamber at the chemical processing for the object, so that the entering of chemicals from the processing bath to the drying chamber can be prevented.

[0075] Moreover, according to an embodiment of the cleaning apparatus of the invention, when closing the opening by the first and second doors, the clearance between the first and second doors can be screened by the flow of inert gas. Accordingly, it is possible to prevent an invasion of the chemical atmosphere from the processing bath to the drying chamber, furthermore.

[0076] Again, according to the cleaning method of the invention, since the drying chamber is separated from the processing bath, the forthcoming process in the next processing bath can be prepared while the drying process is executed, so that the throughput of the cleaning apparatus can be improved. Additionally, since the arrangement allows the drying chamber and the processing bath to be designed under respective conditions independent of each other, it is possible to optimize the cleaning process and further miniaturize the cleaning apparatus because of the enhanced degree of freedom in the process design. Moreover, since the above-mentioned arrangement allows the volume of the drying chamber to be reduced, it is possible to reduce the wall thickness of the drying chamber and the processing bath when it is required to decompress the drying chamber while filling up with the atmosphere of the organic solvent. In addition, it is possible to make the decompression with the low-powered vacuum pump.

40 Claims

1. A cleaning apparatus for cleaning an object (W) to be processed, said apparatus comprising:

a processing bath (41) for storing processing liquid in which said object (W) is to be immersed, said processing bath having an upper portion defining an upper opening;

a drying chamber (42) enclosed with a case arranged entirely above said processing bath, said case having a lower portion defining a lower opening (62), said lower opening being located directly above and spaced apart from said upper opening of the processing bath so as to allow the passage of transporting means carrying objects between said drying chamber and said processing bath;

a transporting means (43) for transporting said

- object (W) between said processing bath (41) and said drying chamber (42) through said upper opening and lower opening (62); filling means (85,86) for filling said drying chamber (42) with an atmosphere of organic solvent; and introducing means (59c) for introducing inert gas into said drying chamber in order to prevent the atmosphere in said processing bath from moving to said drying chamber.
2. A cleaning apparatus as in Claim 1, wherein said introducing means comprises screening means (59c) for screening said lower opening (62) by a current of inert gas.
 3. A cleaning apparatus as in Claim 2 wherein said screening means includes a pair of first and second doors (121) arranged so as to open and partially cover said opening, said first door having a leading end formed to oppose said second door and provided with an output port for discharging inert gas, said second door having a leading end formed to oppose said first door and provided with an intake port for the inert gas, whereby a current of the inert gas is formed between the leading end of said first door and the leading end of said second door, for screening said opening since the inert gas discharged from said output port of said first door is sucked through said intake port of said second door, in a partially covering state of said first and second doors.
 4. A cleaning apparatus as in any one of Claims 1, 2 or 3, further comprising open and shut means for opening and shutting said lower opening, alternatively.
 5. A cleaning apparatus as in any one of Claims 1, 2 or 3, further comprising open and shut means for opening and shutting said lower opening, said open and shut means in a shutting state thereof also sealing said drying chamber.
 6. A cleaning apparatus as in any one of Claims 1, 2 or 3, wherein said filling means includes a nozzle (85,86) for ejecting gas containing said organic solvent into said drying chamber, said nozzle having an inside (88a) and an outside (88b) pipe arranged so that respective circumferential faces thereof are apart from each other; and wherein said inside pipe is provided, in an axial direction thereof, with a plurality of gas outlets (87a) at intervals of a predetermined distance, while said outside pipe is provided, in an axial direction thereof, with a plurality of gas outlets (87b) at intervals shorter than said predetermined distance of said intervals of said inside pipe.
 7. A cleaning apparatus as in Claim 1, wherein said introducing means includes controlling means for controlling flow rate of said inert gas provided into said drying chamber.
 8. A cleaning apparatus as in Claim 1, wherein the drying chamber is cylindrical with its longitudinal axis in a plan parallel to the plane in which the lower opening lies; and said case has an upper portion defining an aperture (61), and a cover (63) arranged on said aperture (61) in order to open or close said aperture (61), said cover being formed in a semi-cylindrical shape whose axis is horizontal.
 9. A cleaning apparatus as in Claim 1, further comprising a slide door (64) located under said lower opening of said drying chamber and above said upper opening of said processing bath, said slide door being mounted slidably between an open position and a closed position in order to open and shut said lower opening alternatively, said slide door being provided with an air grip seal (72a) in a peripheral portion of an upper side thereof, wherein said air grip seal (72a) comes into contact with said lower portion of said case defining said lower opening and seals said lower opening of said drying chamber in order to separate a dry zone in said drying chamber from a wet zone in said processing bath, wherein said transporting means has a holder (75) holding said object to be treated, a guide elevating rod (81) provided with said holder, and a wafer-guide Z-axis mechanism (83) connected to said guide elevating rod for moving said object held by said holder between said processing bath and said drying chamber through said upper opening and said lower opening, said introducing means having an inert gas line connected with said drying chamber for transporting inert gas into said drying chamber in order to prevent an atmosphere in said processing bath from moving into said drying chamber; and said filling means having an organic solvent container containing organic solvent; and an evaporator (89) connected with said organic solvent container and said drying chamber, said evaporator evaporating organic solvent provided from said organic solvent container and being provided into said drying chamber.
 10. A cleaning method of cleaning an object to be processed, using a cleaning apparatus including: a processing bath (41) for storing processing liquid in which said object is immersed, said processing bath having an upper portion defining an upper opening;

a drying chamber (42) enclosed with a case arranged entirely above said processing bath, said case having a lower portion defining a lower opening (62), said lower opening being located directly above and spaced apart from said upper opening so as to allow the passage of transporting means carrying objects to pass between said drying chamber and said processing bath;

a transporting means (43) for transporting said object between said processing bath and said drying chamber through said upper opening and lower opening;

filling means (85,86) for filling said drying chamber with an atmosphere of organic solvent;

introducing means (59c) for introducing inert gas into said drying chamber in order to prevent the atmosphere in said processing bath from moving to said drying chamber;

said cleaning method comprising the steps of:

(a) transporting said object into the processing bath disposed below the drying chamber through the lower opening formed in said drying chamber while retaining said object by a retaining member supported from said drying chamber's side;

(b) storing processing liquid in said processing bath before or after transporting said object from drying chamber into said processing bath and subsequently immersing said object in said processing liquid;

(c) transporting said object from said processing bath into said drying chamber;

(d) filling said drying chamber with an atmosphere of organic solvent and drying said object; and

(e) during immersing said object in said processing liquid, introducing inert gas into said drying chamber in order to prevent the atmosphere in said processing bath from moving to said drying chamber.

11. A cleaning method as in Claim 10 wherein after said step (c) and before said step (d), there is the further step of closing said lower opening after transporting said object processed in said processing bath from said processing bath to said drying chamber.

12. A cleaning method as in Claim 10 or 11 wherein before said step (a) the atmosphere in said drying chamber is replaced with inert gas, before said object is brought into said drying chamber from said outside of the apparatus.

13. A cleaning method as in Claim 10 or 11 wherein be-

fore said step (a), the atmosphere in said drying chamber is replaced with inert gas while exhausting an atmosphere in said drying chamber, before said object is brought into said drying chamber from said outside of the apparatus.

14. A cleaning method as in Claim 10 or 11 wherein said drying chamber is decompressed after the step (d), and thereafter the supply of inert gas is controlled so that the supply volume of the inert gas per unit time increases as time passes while the pressure in said drying chamber recovers from decompressed pressure to atmospheric pressure by introducing the inert gas.

15. A cleaning method as in Claim 10 or 11 wherein the step (b) includes the steps of:

executing chemical cleaning of said object; executing water cleaning of said object; and executing ozone cleaning of said object after said water cleaning.

16. A cleaning method as in Claim 15 wherein the step (b) further include the steps of executing additional water cleaning of said object after said ozone cleaning.

Patentansprüche

1. Reinigungseinrichtung zum Reinigen eines zu bearbeitenden Gegenstands (W), wobei die Einrichtung aufweist:

ein Bearbeitungsbad (41), zum Aufbewahren von Bearbeitungsflüssigkeit, in welche der Gegenstand (W) eingetaucht werden soll, wobei das Bearbeitungsbad einen oberen Abschnitt aufweist, der eine obere Öffnung festlegt;

eine Trocknungskammer (42), die von einem Gehäuse umschlossen ist, das vollständig oberhalb des Bearbeitungsbad angeordnet ist, wobei das Gehäuse einen unteren Abschnitt aufweist, der eine untere Öffnung (62) festlegt, und die untere Öffnung direkt oberhalb der oberen Öffnung und beabstandet von dieser des Bearbeitungsbad angeordnet ist, um den Durchgang einer Transportvorrichtung zu ermöglichen, die Gegenstände zwischen der Trocknungskammer und dem Bearbeitungsbad transportiert;

eine Transportvorrichtung (43) zum Transportieren des Gegenstands (W) zwischen dem Bearbeitungsbad (41) und der Trocknungskammer (42) durch die obere Öffnung und die un-

tere Öffnung (62);

eine Füllvorrichtung (85, 86) zum Füllen der Trocknungskammer (42) mit einer Atmosphäre aus einem organischen Lösungsmittel; und

eine Einlassvorrichtung (59c) zum Einbringen von Inertgas in die Trocknungskammer, um zu verhindern, dass sich die Atmosphäre in dem Bearbeitungsbad in die Trocknungskammer bewegt.

2. Reinigungseinrichtung nach Anspruch 1, bei welcher die Einlassvorrichtung eine Abschirmvorrichtung (59c) zum Abschirmen der unteren Öffnung (62) durch einen Strom aus Inertgas aufweist.
3. Reinigungseinrichtung nach Anspruch 2, bei welcher die Abschirmvorrichtung ein Paar aus einer ersten und einer zweiten Tür (121) aufweist, die so angeordnet sind, dass sie die Öffnung öffnen und teilweise verschließen, wobei die erste Tür ein Vorderende aufweist, das dazu ausgebildet ist, der zweiten Tür gegenüber zu liegen, und mit einer Ausgangsöffnung zum Abgeben von Inertgas versehen ist, die zweite Tür ein Vorderende aufweist, das dazu ausgebildet ist, der ersten Tür gegenüber zu liegen, und mit einer Einlassöffnung für das Inertgas versehen ist, wodurch ein Strom aus Inertgas zwischen dem Vorderende der ersten Tür und dem Vorderende der zweiten Tür erzeugt wird, um die Öffnung abzuschirmen, da das Inertgas, das von der Ausgangsöffnung der ersten Tür abgegeben wird, durch die Einlassöffnung der zweiten Tür angesaugt wird, in einem Zustand, in welchem die erste und die zweite Tür teilweise schließen.
4. Reinigungseinrichtung nach einem der Ansprüche 1, 2 oder 3, welche weiterhin eine Öffnungs- und Schließvorrichtung zum abwechselnden Öffnen und Schließen der unteren Öffnung aufweist.
5. Reinigungseinrichtung nach einem der Ansprüche 1, 2 oder 3, welche weiterhin eine Öffnungs- und Schließvorrichtung zum Öffnen und Schließen der unteren Öffnung aufweist, wobei die Öffnungs- und Schließvorrichtung in ihrem geschlossenen Zustand auch die Trocknungskammer abdichtet.
6. Reinigungseinrichtung nach einem der Ansprüche 1, 2 oder 3, bei welcher die Füllvorrichtung eine Düse (85, 86) zum Ausstoßen von Gas aufweist, welches das organische Lösungsmittel enthält, in die Trocknungskammer, wobei die Düse ein inneres (88a) und ein äußeres (88b) Rohr aufweist, die so angeordnet sind, dass ihre jeweiligen Umfangsoberflächen voneinander beabstandet sind, und

das innere Rohr in seiner Axialrichtung mit mehreren Gasauslässen (87a) in Intervallen mit vorbestimmten Abständen versehen ist, während das äußere Rohr in seiner Axialrichtung mit mehreren Gasauslässen (87b) in Intervallen versehen ist, die kürzer sind als die vorbestimmte Entfernung der Intervalle des inneren Rohrs.

7. Reinigungseinrichtung nach Anspruch 1, bei welcher die Einlassvorrichtung eine Steuervorrichtung zum Steuern der Flussrate des Inertgases aufweist, das der Trocknungskammer zugeführt wird.
8. Reinigungseinrichtung nach Anspruch 1, bei welcher die Trocknungskammer zylinderförmig ist, wobei ihre Längsachse in einer Ebene parallel zu jener Ebene liegt, in welcher die untere Öffnung liegt; und das Gehäuse einen oberen Abschnitt aufweist, der eine Öffnung (61) festlegt, und eine Abdeckung (63), die auf der Öffnung (61) angeordnet ist, um die Öffnung (61) zu öffnen oder zu schließen, wobei die Abdeckung halbzyylinderförmig ist, mit horizontaler Achse.
9. Reinigungseinrichtung nach Anspruch 1, welche weiterhin eine Gleittür (64) aufweist, die unter der unteren Öffnung der Trocknungskammer und oberhalb der oberen Öffnung des BearbeitungsbaDES angeordnet ist, wobei die Gleittür gleitbeweglich zwischen einer geöffneten Position und einer geschlossenen Position angebracht ist, um abwechselnd die untere Öffnung zu öffnen und zu schließen, die Gleittür mit einer Luftdichtung (72a) in einem Umfangsabschnitt an ihrer Oberseite versehen ist, wobei die Luftdichtung (72a) in Berührung mit dem unteren Abschnitt des Gehäuses gelangt, der die untere Öffnung festlegt, und die untere Öffnung der Trocknungskammer abdichtet, um eine trockene Zone in der Trocknungskammer von einer nassen Zone in dem Bearbeitungsbad zu trennen, wobei die Transportvorrichtung einen Halter (75) aufweist, der den zu bearbeitenden Gegenstand hält, eine Führungshebestange (81), die bei dem Halter vorgesehen sind, und einen Waferführungs-Z-Achsenmechanismus (83), der mit der Führungshebestange verbunden ist, um den von dem Halter gehaltenen Gegenstand zwischen dem Bearbeitungsbad und der Trocknungskammer durch die obere Öffnung und die untere Öffnung zu bewegen, die Einlasseinrichtung eine Inertgasleitung aufweist, die mit der Trocknungskammer verbunden ist, um Inertgas in die Trocknungskammer zu transportieren, damit verhindert wird, dass sich eine Atmosphäre in dem Bearbeitungsbad in die Trocknungskammer bewegt; und

die Füllvorrichtung einen Behälter für organisches Lösungsmittel aufweist, der organisches Lösungsmittel enthält; und

ein Verdampfer (89) mit dem Behälter für organisches Lösungsmittel und der Trocknungskammer verbunden ist, und der Verdampfer organisches Lösungsmittel verdampft, das von dem Behälter für organisches Lösungsmittel geliefert wird, und in die Trocknungskammer zugeführt wird.

10. Reinigungsverfahren zum Reinigen eines zu bearbeitenden Gegenstands unter Verwendung einer Reinigungsvorrichtung, welche aufweist:

ein Bearbeitungsbad (41) zum Aufbewahren von Bearbeitungsflüssigkeit, in welche der Gegenstand eingetaucht wird, wobei das Bearbeitungsbad einen oberen Abschnitt aufweist, der eine obere Öffnung festlegt;

eine Trocknungskammer (42), die von einem Gehäuse umschlossen ist, das vollständig oberhalb des Bearbeitungsbad angeordnet ist, wobei das Gehäuse einen unteren Abschnitt aufweist, der eine untere Öffnung (62) festlegt, und die untere Öffnung direkt oberhalb der oberen Öffnung und von dieser beabstandet angeordnet ist, um den Durchgang einer Transportvorrichtung zu ermöglichen, die Gegenstände transportiert, sodass diese zwischen der Trocknungskammer und dem Bearbeitungsbad hindurchgehen kann;

eine Transportvorrichtung (43) zum Transportieren des Gegenstands zwischen dem Bearbeitungsbad und der Trocknungskammer durch die obere Öffnung und die untere Öffnung;

eine Füllvorrichtung (85, 86), zum Füllen der Trocknungskammer mit einer Atmosphäre aus einem organischen Lösungsmittel;

eine Einlassvorrichtung (59c) zum Einlassen von Inertgas in die Trocknungskammer, um zu verhindern, dass sich die Atmosphäre in dem Bearbeitungsbad zu der Trocknungskammer bewegt;

wobei das Reinigungsverfahren folgende Schritte umfasst;

(a) Transportieren des Gegenstandes in das Bearbeitungsbad, das unterhalb der Trocknungskammer angeordnet ist, durch die in der Trocknungskammer vorgesehene untere Öffnung, während der Gegenstand durch ein Halteglied gehalten wird, das von der Seite der

Trocknungskammer aus gehalten ist;

(b) Aufbewahren von Bearbeitungsflüssigkeit in dem Bearbeitungsbad vor oder nach dem Transport des Gegenstands von der Trocknungskammer in das Bearbeitungsbad, und nachfolgendes Eintauchen des Gegenstands in die Bearbeitungsflüssigkeit;

(c) Transportieren des Gegenstands von dem Bearbeitungsbad in die Trocknungskammer;

(d) Füllen der Trocknungskammer mit einer Atmosphäre aus organischem Lösungsmittel, und Trocknen des Gegenstands; und

(e) Einlassen, während des Eintauchens des Gegenstands in die Bearbeitungsflüssigkeit, von Inertgas in die Trocknungskammer, um zu verhindern, dass sich die Atmosphäre in dem Bearbeitungsbad zu der Trocknungskammer bewegt.

11. Reinigungsverfahren nach Anspruch 10, bei welchem nach dem Schritt (c) und vor dem Schritt (d) der weitere Schritt vorgesehen ist, die untere Öffnung zu schließen, nach dem Transport des Gegenstands, der in dem Bearbeitungsbad bearbeitet wird, von dem Bearbeitungsbad zu der Trocknungskammer.

12. Reinigungsverfahren nach Anspruch 10 oder 11, bei welchem vor dem Schritt (a) die Atmosphäre in der Trocknungskammer durch Inertgas ersetzt wird, bevor der Gegenstand in die Trocknungskammer von außerhalb der Einrichtung verbracht wird.

13. Reinigungsverfahren nach Anspruch 10 oder 11, bei welchem vor dem Schritt (a) die Atmosphäre in der Trocknungskammer durch Inertgas ersetzt wird, während die Atmosphäre in der Trocknungskammer abgesaugt wird, bevor der Gegenstand in die Trocknungskammer von außerhalb der Einrichtung verbracht wird.

14. Reinigungsverfahren nach Anspruch 10 oder 11, bei welchem die Trocknungskammer nach dem Schritt (d) druckentlastet wird, und danach die Zufuhr von Inertgas so gesteuert wird, dass das zugeführte Volumen an Inertgas pro Zeiteinheit im Verlaufe der Zeit zunimmt, während der Druck in der Trocknungskammer von dem entlasteten Druck auf Atmosphärendruck durch Zuführen des Inertgases zurückkehrt.

15. Reinigungsverfahren nach Anspruch 10 oder 11, bei welchem vor dem Schritt (b) folgende Schritte umfasst:

Durchführen einer chemischen Reinigung des Gegenstands; Durchführen einer Wasserreinigung des Gegenstands; und Durchführen einer Ozonreinigung des Gegenstands nach der Wasserreinigung.

16. Reinigungsverfahren nach Anspruch 15, bei welchem der Schritt (b) weiterhin die Schritte umfasst, eine zusätzliche Wasserreinigung des Gegenstands nach der Ozonreinigung durchzuführen.

Revendications

1. Appareil de nettoyage permettant de nettoyer un objet (W) à traiter, ledit appareil comprenant :

un bain de traitement (41) permettant de stocker un liquide de traitement dans lequel ledit objet (W) doit être immergé, ledit bain de traitement présentant une partie supérieure définissant une ouverture supérieure ;

une chambre de séchage (42) comprise dans un récipient disposé entièrement au-dessus dudit bain de traitement, ledit récipient présentant une partie inférieure définissant une ouverture inférieure (62), ladite ouverture inférieure étant disposée directement au-dessus de ladite ouverture supérieure du bain de traitement, à quelque distance de celle-ci, afin de permettre le passage d'un moyen de transport transportant des objets entre ladite chambre de séchage et ledit bain de traitement ;

un moyen de transport (43) servant à transporter ledit objet (W) entre ledit bain de traitement (41) et ladite chambre de séchage (42) via ladite ouverture supérieure et ladite ouverture inférieure (62) ;

des moyens de remplissage (85, 86) servant à remplir ladite chambre de séchage (42) avec une atmosphère de solvant organique ; et un moyen d'introduction (59c) servant à introduire un gaz inerte dans ladite chambre de séchage afin d'empêcher l'atmosphère présente dans ledit bain de traitement d'atteindre la chambre de séchage.

2. Appareil de nettoyage selon la revendication 1, dans lequel ledit moyen d'introduction comprend un moyen d'écran (59c) servant à faire écran au niveau de ladite ouverture inférieure (62) au moyen d'un courant de gaz inerte.

3. Appareil de nettoyage selon la revendication 2, dans lequel

ledit moyen d'écran comprend une paire de première et seconde portes (121) disposée de manière à découvrir et à couvrir partiellement ladite

ouverture, ladite première porte ayant une extrémité avant formée pour s'opposer à ladite seconde porte et munie d'un orifice d'évacuation servant à évacuer le gaz inerte, ladite seconde porte ayant une extrémité avant formée pour s'opposer à ladite première porte et munie d'un orifice d'aspiration de gaz inerte, un courant de gaz inerte étant formé entre l'extrémité avant de ladite première porte et l'extrémité avant de ladite seconde porte dans le but de faire écran au niveau de ladite ouverture en conséquence du fait qu'un gaz inerte émis par ledit orifice d'évacuation de ladite première porte est aspiré par ledit orifice d'aspiration de ladite seconde porte, dans un état de couverture partielle obtenu au moyen desdites première et seconde portes.

4. Appareil de nettoyage selon l'une quelconque des revendications 1, 2 ou 3, comprenant en outre un moyen d'ouverture et d'obturation permettant de découvrir ou bien d'obturer ladite ouverture inférieure.

5. Appareil de nettoyage selon l'une quelconque des revendications 1, 2 ou 3, comprenant en outre un moyen d'ouverture et d'obturation permettant de découvrir ou bien d'obturer ladite ouverture inférieure, ledit moyen d'ouverture et d'obturation permettant également de fermer hermétiquement ladite chambre de séchage lorsqu'il se trouve à l'état d'obturation.

6. Appareil de nettoyage selon l'une quelconque des revendications 1, 2 ou 3, dans lequel ledit moyen de remplissage comprend une buse (85, 86) servant à injecter le gaz contenant ledit solvant organique dans ladite chambre de séchage, ladite buse ayant un tube intérieur (88a) et un tube extérieur (88b) disposés de manière à ce que leurs faces circumférentielles respectives soient espacées l'une de l'autre ; et dans lequel ledit tube intérieur est muni, dans sa direction axiale, d'une pluralité d'orifices d'émission de gaz (87a) espacés à intervalles prédéterminés tandis que ledit tube extérieur est muni, dans sa direction axiale, d'une pluralité d'orifices d'émission de gaz (87b) à intervalles plus petits que lesdits intervalles prédéterminés dudit tube intérieur.

7. Appareil de nettoyage selon la revendication 1, dans lequel

ledit moyen d'introduction comprend un moyen de régulation servant à réguler le débit dudit gaz inerte apporté dans ladite chambre de séchage.

8. Appareil de nettoyage selon la revendication 1, dans lequel

la chambre de séchage est cylindrique, son

axe longitudinal étant dans un plan parallèle au plan dans lequel se trouve l'ouverture inférieure ; et

ledit récipient présente une partie supérieure définissant une fenêtre (61) et un couvercle (63) disposé sur ladite fenêtre (61) afin de découvrir ou d'obturer ladite fenêtre (61), ledit couvercle étant de forme semi-cylindrique à axe horizontal.

9. Appareil de nettoyage selon la revendication 1, comprenant en outre une porte coulissante (64) située sous ladite ouverture inférieure de ladite chambre de séchage et au-dessus de ladite ouverture supérieure dudit bain de traitement, ladite porte coulissante étant montée de manière à pouvoir coulisser entre une position d'ouverture et une position de fermeture permettant de découvrir ou bien d'obturer ladite ouverture inférieure, ladite porte coulissante étant munie d'un joint à prise d'air (72a) dans une partie périphérique d'un côté supérieur de celle-ci, ledit joint à prise d'air (72a) venant en contact avec ladite partie inférieure dudit récipient définissant ladite ouverture inférieure et obturant hermétiquement ladite ouverture inférieure de ladite chambre de séchage afin de séparer une zone sèche présente dans ladite chambre de séchage d'une zone humide présente dans ledit bain de traitement, dans lequel ledit moyen de transport comporte un porte-objet (75) servant à porter ledit objet devant être traité, une barre d'élévation (81) du dispositif de guidage munie dudit porte-objet et un mécanisme (83) de guidage des plaquettes semi-conductrices sur l'axe des Z raccordé à ladite barre d'élévation du dispositif de guidage permettant de déplacer ledit objet tenu par ledit porte-objet entre ledit bain de traitement et ladite chambre de séchage via ladite ouverture supérieure et ladite ouverture inférieure, ledit moyen d'introduction présentant une conduite de gaz inerte raccordée à ladite chambre de séchage permettant de transporter le gaz inerte dans ladite chambre de séchage afin d'empêcher une atmosphère présente dans ledit bain de traitement d'atteindre ladite chambre de séchage ; ledit moyen de remplissage présentant un réservoir de solvant organique contenant ledit solvant organique ; et un évaporateur (89) raccordé audit réservoir de solvant organique et à ladite chambre de séchage, ledit évaporateur permettant d'évaporer le solvant organique provenant dudit réservoir de solvant organique et amené dans ladite chambre de séchage.
10. Procédé de nettoyage permettant de nettoyer un objet à traiter, mettant en oeuvre un appareil de nettoyage comprenant :
 - un bain de traitement (41) contenant un liquide

de traitement dans lequel ledit objet est immergé, ledit bain de traitement présentant une partie supérieure définissant une ouverture supérieure ;

une chambre de séchage (42) comprise dans un récipient disposé entièrement au-dessus dudit bain de traitement, ledit récipient ayant une partie inférieure définissant une ouverture inférieure (62), ladite ouverture inférieure étant disposée directement au-dessus de ladite ouverture supérieure, à quelque distance de celle-ci, afin de permettre le passage d'un moyen de transport transportant des objets devant passer entre ladite chambre de séchage et ledit bain de traitement ; un moyen de transport (43) servant à transporter ledit objet entre ledit bain de traitement et ladite chambre de séchage via ladite ouverture supérieure et ladite ouverture inférieure ; des moyens de remplissage (85, 86) servant à remplir ladite chambre de séchage avec une atmosphère de solvant organique ; et un moyen d'introduction (59c) servant à introduire un gaz inerte dans ladite chambre de séchage afin d'empêcher l'atmosphère présente dans ledit bain de traitement d'atteindre la chambre de séchage ledit procédé de nettoyage comprenant les étapes consistant à :

- (a) transporter ledit objet dans le bain de traitement disposé sous la chambre de séchage via l'ouverture inférieure formée dans ladite chambre de séchage tout en retenant ledit objet au moyen d'un élément de retenue s'appuyant sur le côté de ladite chambre de séchage ;
- (b) stocker le liquide de traitement dudit bain de traitement avant et après le transport dudit objet depuis ladite chambre de séchage vers ledit bain de traitement puis immersion dudit objet dans ledit liquide de traitement ;
- (c) transporter ledit objet depuis le bain de traitement vers ladite chambre de séchage ;
- (d) remplir ladite chambre de séchage d'une atmosphère de solvant organique et sécher ledit objet ; et
- (e) durant l'immersion dudit objet dans ledit liquide de traitement, introduire du gaz inerte dans ladite chambre de séchage afin d'empêcher l'atmosphère présente dans ledit bain de traitement d'atteindre ladite chambre de séchage.

11. Procédé de nettoyage selon la revendication 10, dans lequel, après ladite étape (c) et avant l'étape

(d), on réalise l'étape supplémentaire consistant à obturer ladite ouverture inférieure après que ledit objet traité dans ledit bain de traitement a été transporté dudit bain de traitement à ladite chambre de séchage.

5

12. Procédé de nettoyage selon la revendication 10 ou 11, dans lequel, préalablement à ladite étape (a), on remplace l'atmosphère présente dans ladite chambre de séchage par un gaz inerte avant que ledit objet en provenance dudit extérieur de l'appareil ne soit apporté dans ladite chambre de séchage.

10

13. Procédé de nettoyage selon la revendication 10 ou 11, dans lequel, préalablement à ladite étape (a), on remplace l'atmosphère présente dans ladite chambre de séchage par un gaz inerte tandis qu'on évacue l'atmosphère présente dans ladite chambre de séchage, avant que ledit objet en provenance dudit extérieur de l'appareil ne soit apporté dans ladite chambre de séchage.

15

20

14. Procédé de nettoyage selon la revendication 10 ou 11, dans lequel ladite chambre de séchage est décompressée après l'étape (d), après quoi l'apport de gaz inerte est régulé de manière à ce que le volume d'amenée du gaz inerte par unité de temps augmente avec le temps tandis que la pression présente dans ladite chambre de séchage passe de la pression décompressée à la pression atmosphérique par introduction de gaz inerte.

25

30

15. Procédé de nettoyage selon la revendication 10 ou 11, dans lequel l'étape (b) comprend les opérations consistant à :

35

effectuer le nettoyage chimique dudit objet, effectuer le nettoyage à l'eau dudit objet et effectuer le nettoyage à l'ozone dudit objet après ledit nettoyage à l'eau.

40

16. Procédé de nettoyage selon la revendication 15, dans lequel l'étape (b) comprend en outre les opérations consistant à effectuer de nouveau un nettoyage à l'eau dudit objet après ledit nettoyage à l'ozone.
